

SAFETY THROUGH SYSTEMS AND DIGITALIZATION

STRENGTHENING BOILER SAFETY THROUGH BETTER VISIBILITY AND CONTROL

Boiler operations are a critical part of manufacturing, and the people who work closest to these systems need the right visibility, information and controls to do their work safely. During FY2025/26, Haycarb commenced Phase 1 of our boiler digitalization program, beginning with the successful digitalization of boilers at the Madampe and Badalgama manufacturing locations in Sri Lanka.

The upgrade gives operators clearer oversight of boiler performance and key operating parameters, helping create a more controlled working environment. With better access to real-time information, teams are supported to monitor operations more closely, identify changes faster and respond with greater confidence.

This initiative forms part of Haycarb's wider approach to health and safety, alongside the Group's health and safety management system, PPE provision, regular training and continued investments to improve safety conditions at production locations. As the program expands, it will continue to strengthen safety controls, process visibility and the day-to-day protection of the people behind our operations.

Why it matters

Boiler digitalization helps make safety more visible and more practical at the point of operation. By improving access to information and strengthening control over key systems, it supports a safer working environment for operators while also improving process oversight and operational confidence.
