

EXPLORING NATURE-RELATED DEPENDENCIES

In line with SLFRS S1 and S2, we have identified and disclosed sustainability and climate related risks and opportunities that could reasonably be expected to affect the Group's resilience and financial position through our existing climate risk and financial reporting processes (refer SLFRS S1 and S2 disclosures – page 63).

At present, we have not undertaken a Taskforce on Nature-related Financial Disclosures (TNFD) aligned assessment and are only at an early, exploratory stage in considering nature-related dependencies .

Our GRI-based assessment currently does not identify biodiversity as one of our most material impact topics, because our operations and supply chain have not been found to create significant direct impacts on sensitive habitats, while other environmental topics such as energy, emissions, water and waste continue to be treated as material and are reported separately.

At the same time, we recognise that our business depends on healthy agricultural

landscapes and reliable water resources, particularly through our dependence on coconut shell and coconut shell charcoal supply chains and water-intensive manufacturing processes.

Accordingly, we are beginning to monitor these broader nature-related dependencies as part of our wider climate, resilience and risk management thinking, and expect our approach to evolve over time in line with emerging business needs, data availability and disclosure expectations.
